

llvm 上手第一个pass检查驼峰

一、环境配置

目前本人使用环境：

🌟 macos 12.6
xcode 14.0.1
clang&&llvm 13.0.1

那就找xcode 对应版本的llvm，本人安装的是llvm 13.0.1_2

```
1 sudo brew install llvm@13
```

二、编译

1、拷贝llvm 导师项目

```
1 git clone https://github.com/banach-space/llvm-tutor
```

2、配置llvm和项目路径

```
1 export LLVM_DIR=/opt/homebrew/Cellar/llvm@13/13.0.1_2  
2 export LLVM_TUTOR_DIR=/Users/xiakejie/ME/break/llvm-tutor
```

3、编译dylib

```
1 mkdir build  
2 cd $build  
3 cmake -DLT_LLVM_INSTALL_DIR=$LLVM_DIR ../  
4 make
```

4、练练手

拿libHelloWorld.dylib

.c 转.bc 文件上一篇文章有讲到

```
1 $LLVM_DIR/bin/clang -O1 -S -emit-llvm $LLVM_TUTOR_DIR/inputs/input_for_hello.c
2
3 $LLVM_DIR/bin/opt -load libHelloWorld.dylib -helloworld ./hello.bc -o /dev/null
4
5 $LLVM_DIR/bin/opt -load ./libHelloWorld.dylib -help | grep hello
6
```

```
+ build_hello git:(main) x $LLVM_DIR/bin/opt -load libHelloWorld.dylib -helloworld ./hello.bc -o /dev/null -time-passes -enable-new-pm=0
(llvm-tutor) Hello from: main
(llvm-tutor)   number of arguments: 2
(llvm-tutor) Hello from: luck
(llvm-tutor)   number of arguments: 2
=====
... Pass execution timing report ...
=====
Total Execution Time: 0.0004 seconds (0.0012 wall clock)

---User Time---  ---System Time---  ---User+System---  ---Wall Time---  ---Instr---  --- Name ---
0.0001 ( 87.2%)  0.0003 ( 95.9%)  0.0004 ( 93.3%)  0.0011 ( 97.6%)  1839466  Bitcode Writer
0.0000 (  2.6%)  0.0000 (  3.7%)  0.0000 (  3.4%)  0.0000 (  1.2%)  145241  Hello World Pass
0.0000 ( 10.3%)  0.0000 (  0.4%)  0.0000 (  3.4%)  0.0000 (  1.2%)  156308  Module Verifier
0.0001 (100.0%)  0.0003 (100.0%)  0.0004 (100.0%)  0.0012 (100.0%)  2141015  Total
=====

LLVM IR Parsing
=====
Total Execution Time: 0.0010 seconds (0.0073 wall clock)

---User Time---  ---System Time---  ---User+System---  ---Wall Time---  ---Instr---  --- Name ---
0.0002 (100.0%)  0.0009 (100.0%)  0.0010 (100.0%)  0.0073 (100.0%)  4559388  Parse IR
0.0002 (100.0%)  0.0009 (100.0%)  0.0010 (100.0%)  0.0073 (100.0%)  4559388  Total
```

5、写一个驼峰命名规范检查的pass

```
1 #include <iostream>
2 #include "clang/AST/AST.h"
3 #include "clang/AST/ASTConsumer.h"
4 #include "clang/ASTMatchers/ASTMatchers.h"
5 #include "clang/ASTMatchers/ASTMatchFinder.h"
6 #include "clang/Frontend/CompilerInstance.h"
7 #include "clang/Frontend/FrontendPluginRegistry.h"
8
9 using namespace clang;
10 using namespace std;
11 using namespace llvm;
12 using namespace clang::ast_matchers;
13
14 namespace TestPlugin {
15     class TestHandler : public MatchFinder::MatchCallback{
```

```

16 private:
17     CompilerInstance &ci;
18 public:
19     TestHandler(CompilerInstance &ci) :ci(ci) {}
20     //判断是否是用户源文件
21     bool isUserSourceCode(const string filename) {
22         //文件名不为空
23         if (filename.empty()) return false;
24         //非xcode中的源码都认为是用户的
25         if (filename.find("/Applications/Xcode.app/") == 0) return false;
26         if (filename.find("/Applications/Xcode13.4.app/") == 0) return false;
27         return true;
28     }
29
30     // 代码检查的回调方法
31     void run(const MatchFinder::MatchResult &Result) {
32
33         // 检查类名(Interface), 不能带有下列线
34         if (const ObjCInterfaceDecl *decl = Result.Nodes.getNodeAs<ObjCInter
35             string filename = ci.getSourceManager().getFilename(decl->getSou
36             if ( !isUserSourceCode(filename) ) return;
37             size_t pos = decl->getName().find('_');
38             if (pos != StringRef::npos) {
39                 DiagnosticsEngine &D = ci.getDiagnostics();
40                 // 获取位置
41                 SourceLocation loc = decl->getLocation().getLocWithOffset(po
42                 D.Report(loc, D.getCustomDiagID(DiagnosticsEngine::Warning,
43             }
44         }
45         // 检查变量(Interface), 不能带有下列线
46         if (const VarDecl *decl = Result.Nodes.getNodeAs<VarDecl>("VarDecl")
47             string filename = ci.getSourceManager().getFilename(decl->getSou
48             if ( !isUserSourceCode(filename) ) return;
49             size_t pos = decl->getName().find('_');
50             if (pos != StringRef::npos && pos != 0) {
51                 DiagnosticsEngine &D = ci.getDiagnostics();
52                 SourceLocation loc = decl->getLocation().getLocWithOffset(po
53                 D.Report(loc, D.getCustomDiagID(DiagnosticsEngine::Warning,
54             }
55         }
56     }
57 };
58
59 // 定义语法树的接受事件
60 class TestASTConsumer: public ASTConsumer{
61 private:

```

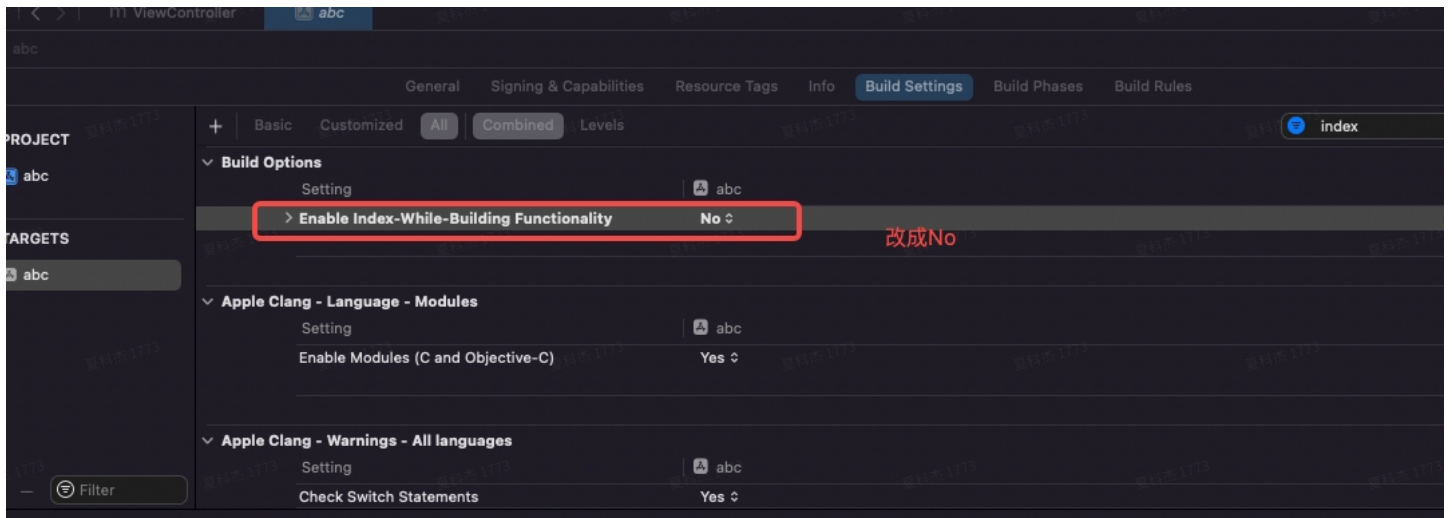

```

63     MatchFinder matcher;
64     TestHandler handler;
65
66     public:
67         TestASTConsumer(CompilerInstance &ci) : handler(ci) {
68             matcher.addMatcher(objcInterfaceDecl().bind("ObjCInterfaceDecl"), &h
69             matcher.addMatcher(varDecl().bind("VarDecl"), &handler);
70             matcher.addMatcher(objcMethodDecl().bind("ObjCMethodDecl"), &handler
71         }
72         void HandleTranslationUnit(ASTContext &Ctx) {
73             printf("TestPlugin1: All ASTs has parsed.");
74             DiagnosticsEngine &D = Ctx.getDiagnostics();
75             // 在编译log中可以看到
76             // D.Report(D.getCustomDiagID(DiagnosticsEngine::Warning, "TestPlugin
77             // D.Report(D.getCustomDiagID(DiagnosticsEngine::Error, "TestPlugin错
78             matcher.matchAST(Ctx);
79         }
80     };
81
82
83     // 定义触发插件的动作
84     class TestAction : public PluginASTAction{
85     public:
86         unique_ptr<ASTConsumer> CreateASTConsumer(CompilerInstance &CI,
87            StringRef InFile){
88             return unique_ptr<TestASTConsumer> (new TestASTConsumer(CI));
89         }
90
91         bool ParseArgs(const CompilerInstance &CI,
92             const std::vector<std::string> &arg){
93             return true;
94         }
95     };
96 }
97 // 告知clang,注册一个新的plugin
98 static FrontendPluginRegistry::Add<TestPlugin::TestAction>
99 X("TestPlugin", "Test a new Plugin");
100 // X 变量名,可随便写,也可以写自己有意思的名称
101 // TestPlugin 插件名称,很重要,这个是对外的名称
102 // Test a new Plugin 插件备注

```

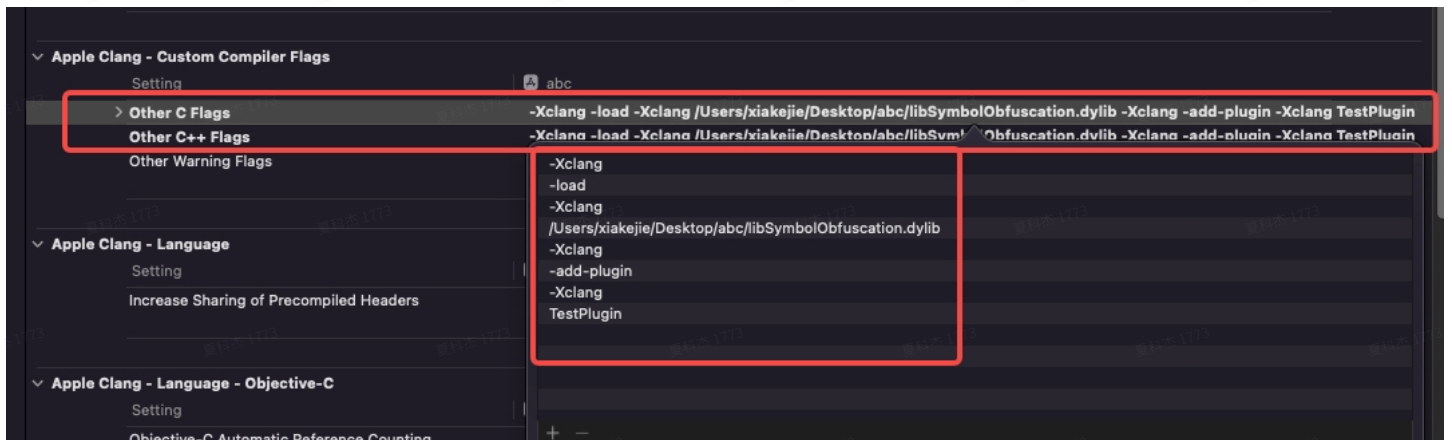

5、xcode 配置

5.1、配置Build Options

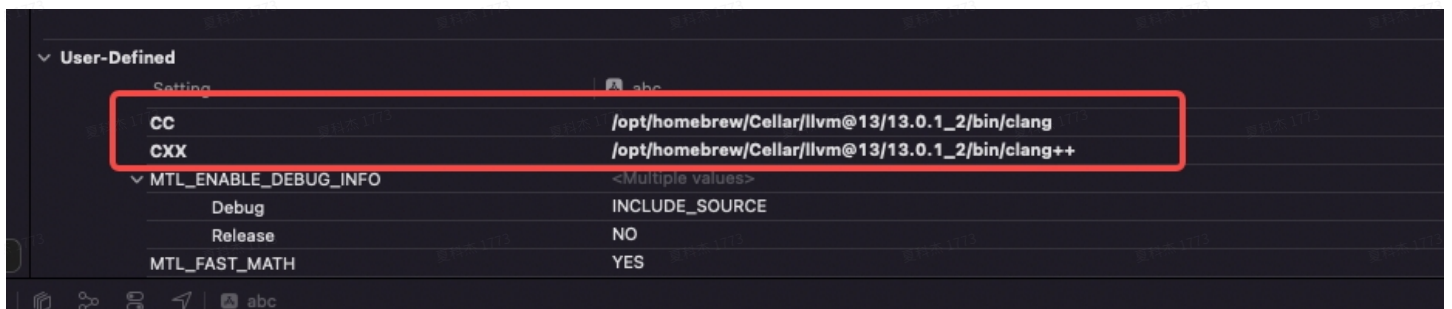

5.2、配置Other C Flags && Other C++ Flags

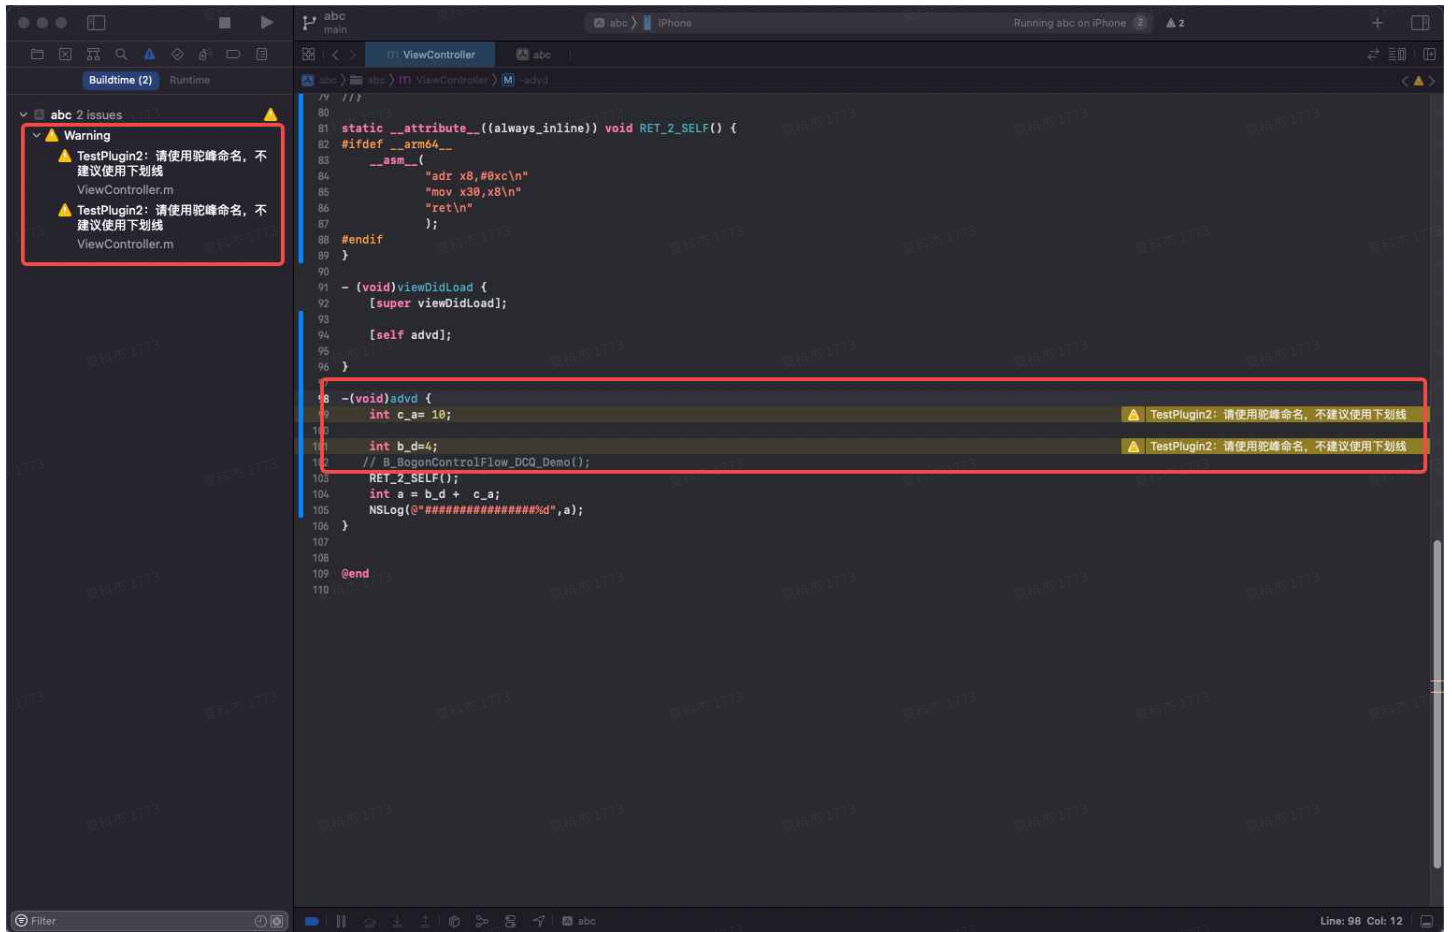

```
1 -Xclang -load -Xclang /Users/xiakejie/Desktop/abc/libSymbolObfuscation.dylib -Xc
```

5.3、User-Defined 配置cc 和cxx 路径

三、效果

四、后续

1、代码检查规范完善后，可以部署到jenkins 上做代码规范检查。

五、下一步

1、写代码混淆pass
